

Date 19 June 2016. Black Sugarloaf, Birralee (big tree track).

Habitat: Closed wet Eucalypt forest.

Substrate: Leaves and twigs fallen on big tree log.

Description: Scattered flattened circular sporangia and plasmodiocarps, 1.2–3 mm across x 0.3 mm high. Pinkish white with brown at base edge. **Peridium:** Outer layer pinkish white, shiny and slightly wrinkled, cracking, fragile; inner membranous layer closely adhering. **Hypothallus** inconspicuous. **Columella** flat, pinkish brown, covers base of sporangia or plasmodiocarp. **Capillitium** abundant, white in reflected light, hyaline in transmitted light, some branching. **Spores** dark brown in mass, brown in transmitted light, lighter on one side, scattered warts, 10–11 μ m.

Note Spores too large for this species and sporangia not as 'effused' as descriptions suggest. Spore feature (i.e. lighter on one side) not mentioned in descriptions.
